

# Chapter 1

## Software requirement specification

### 1.1 Introduction

#### 1.1.1 Purpose

The software requirement specification should provide all needed information to develop the context extraction framework and define all delivery objects. All interfaces to external components, input and output data, deployment considerations and quality attribute should be well defined within this document.

#### 1.1.2 Scope

The context extraction framework will perform automated text extraction on a set of HTML test data with two to three different text extraction algorithms. The performance of each algorithm is measured and an output file with the measured results is generated.

### 1.2 General description

#### 1.2.1 Operating Environment

see travis ci

### 1.2.2 Design and Implementation Constraints

## 1.3 System Features

In this chapter, each system feature is specified.

<b>Name</b>	Read configuration
<b>Feature id</b>	f1
<b>Description</b>	<p>The text extraction framework is configurable with an external text file. The configuration file will contain following items:</p> <ul style="list-style-type: none"><li>• Path to folder with html files</li><li>• Path to folder with text files</li><li>• Path to folder with output files</li><li>• Configuration for algorithms</li><li>• etc.</li></ul> <p>The configuration file location is defined as a relative path to the source directory. The configuration file is structured in a key value list:</p> <hr/> <pre>key:value; key:value; key:value;</pre> <hr/>
<b>Relevance</b>	needed
<b>Related stories</b>	tbd

<b>Name</b>	Create test
<b>Feature id</b>	f2
<b>Description</b>	<p>A test contains two input files which are a html file and a text file. They are located in the defined directories by the configuration. As soon as the test framework finds a html and a text file with the same name, a new test is created and the files are read.</p>
<b>Relevance</b>	needed
<b>Related stories</b>	tbd

<b>Name</b>	Run test
<b>Feature id</b>	f3
<b>Description</b>	A test is run as defined in the configuration file. The configuration file defines which algorithms are tested. The output of a test is a text file which contains the results.
<b>Relevance</b>	needed
<b>Related stories</b>	tbd

<b>Name</b>	Integrate Justext algorithm
<b>Feature id</b>	f4
<b>Description</b>	If the justext algorithm is activated in the configuration file and a test is run, the HTML file is extracted with justext.
<b>Relevance</b>	needed
<b>Related stories</b>	tbd

<b>Name</b>	Integrate Boilerpipe algorithm
<b>Feature id</b>	f5
<b>Description</b>	If the Boilerpipe algorithm is activated in the configuration file and a test is run, the HTML file is extracted with Boilerpipe.
<b>Relevance</b>	needed
<b>Related stories</b>	tbd

<b>Name</b>	Integrate RSS feed algorithm
<b>Feature id</b>	f6
<b>Description</b>	If the RSS feed algorithm algorithm is activated in the configuration file and a test is run, the HTML file is extracted with the RSS feed algorithm.
<b>Relevance</b>	nice to have
<b>Related stories</b>	tbd

<b>Name</b>	Comparison of extracted text files
<b>Feature id</b>	f6
<b>Description</b>	<p>Each output file from the different algorithm needs to be compared to the text file with the actual content.</p> <ul style="list-style-type: none"> <li>• Split HTML document into blocks separated by HTML tags</li> <li>• Define which blocks are content and which are boilerplate based on the text file which defines the content</li> <li>• Define which blocks are content and which are boilerplate based on the output file of each text extraction algorithm</li> <li>• Compare the results and categorize all blocks as true negative or false positive</li> <li>• Put the results into an output text file (structure output file: tbd)</li> </ul>
<b>Relevance</b>	nice to have
<b>Related stories</b>	tbd

<b>Name</b>	Analyze data
<b>Feature id</b>	f7
<b>Description</b>	<p>The generated output data is used to perform some further calculations. Possible values to calculate are:</p> <ul style="list-style-type: none"> <li>• Precision: <math>\frac{TP}{TP+FP}</math></li> <li>• Recall/True positive rate (TPR): <math>\frac{TP}{TP+FN}</math></li> <li>• false positive rate (FPR: <math>\frac{FP}{FP+TN}</math></li> <li>• F-measure: <math>2 * \frac{precision*recall}{precision+recall}</math></li> <li>• Reciever Operation Characteristics (ROC): <math>TPR = f(FPR)</math></li> </ul> <p>Precision / Recall / ROC / AUC</p>
<b>Relevance</b>	needed
<b>Related stories</b>	tbd

## 1.4 Data Requirements

## 1.5 External Interface Requirements

### 1.5.1 Boilerpipe

The boilerpipe algorithm is already implemented in Java so it is easy to integrate. The API can be found under following link. <https://code.google.com/p/boilerpipe/>

Other useful links:

Getting started: <http://code.google.com/p/boilerpipe/wiki/QuickStart>

javadoc extractor: <http://boilerpipe.googlecode.com/svn/trunk/boilerpipe-core/javadoc/1.0/de/l3s/boilerpipe/extractors/ExtractorBase.html>

### 1.5.2 justext

The justext algorithm is implemented in python and it is not yet defined how it will be integrated into the text extraction framework. See risk analysis. The documentation can be found under following link:

<https://code.google.com/p/justext/>

jython: <http://www.jython.org/>

## 1.6 Quality Attributes
